Leader  
in turbo-expander  
hardware production

**UTDU**

Design and implementation of power recycling turbo-expander units (UTDU) at gas distribution stations and gas treatment plants are one of the PJSC "Turbogaz" profile activities. Power recycling turbo-expander units are designed to generate electric power at the expense of excessive gas pressure drop at the turbine, loaded with generator. Depending on the power recycling unit deployment (gas distribution station (GDS), gas distribution point (GDP), or gas treatment plant (GTP), it can solve the following tasks:

- If installed at GDS and GDP, it generates electric power. Preliminary gas heating is required to ensure standard gas temperature at GDS or GDP outlet;

- If installed at GTP, it generates electric power and ensures gas cooling. Preliminary gas heating is not required.

PJSC "Turbogas" has designed and made commercially available UTDU of the capacities ranging from 8 kW to 8 MW with gas pressure of 6.3 MPa. Depending on the initial parameters the turbo-expander units could be of different designs:

- For available low pressure drop in the turbine and big gas consumption PJSC "Turbogaz" designs and manufactures multi-stage (up to 6 stages) axial turbines to work on a direct drive, i.e., the turbine is directly combined with the generator shaft via transmission. In this design the turbine rotor speed is 3,000 rpm.

- For high pressure drops at the turbine ( $P_t > 2$ ) PJSC "Turbogaz" designs & manufactures UTDU with reduction gear. In this design the generator speed is 3,000 rpm, and turbine rotor speed is 8,000 rpm.

Power recycling turbo-expander units are designed to be used with the Ukrainian manufactured reduction gears as well as with BHS (Germany) reduction gear

Power recycling turbo-expander units are manufactured and supplied as a complete package with all the auxiliary equipment to include: lube oil system, dry gas seals system, switchgear and control gear cabinets, shut-off and control valves, including also quick acting shutoff valve at the turbine inlet as well as proportioning valve and bypass control valve at the turbine by-pass, heat-exchanger & gas reheater, automatic control system (ACS).

Structurally turbo-expander is manufactured at the highest technical level:

- Each turbine stage presupposes to have an adjustable nozzle assembly providing for the unit optimal operation in different modes and for obtaining the maximum efficiency ratio;

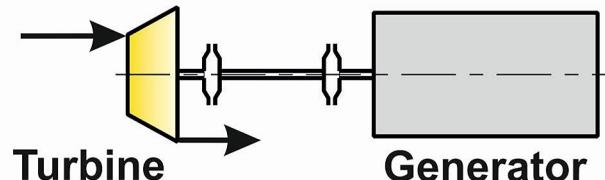

- Dry gas seals, that increase the unit environmental friendliness, are used in the expander

- Flexible dry transmission of BHS Company (Germany) is used from the generator.

## Advantages of Turbo-Expander Units Produced by PJSC "Turbogaz"

Advantages of UTDU and NTDA produced by PJSC "Turbogaz":

- Individual approach to every project, i.e., UTDU and NTDA design and production apply directly to the running conditions of the specific site
- Equipment could be supplied in different configurations depending on Customer's requirements, i.e.:
  - UTDU supplied in a set with generator, low/high voltage equipment, ACS, locking-metering unit, bypass-adjustment unit, heat exchanging equipment, etc.
  - Supply time is reduced
  - Wide range of equipment applications as regards climatic conditions, productivity, capacity
  - Wide range of support services (engineering, Feasibility Study development, supervised installation, start-up and commissioning, Customer's staff training, warranty and post-warranty servicing, spare parts supply)
  - Quick response to Customers calls regarding their sites' visiting
